DB Systel UK Backup Solutions

If like many organisations, your data is amongst your most valuable assets, or if regulations mandate that you must comply with strict data protection policies, then you must ask yourself what is the cost to the organisation if that data was unavailable or lost.

Whether the threat to your data comes from hardware failure, cybercrime, theft or human error, you must have a data protection strategy to ensure that you can recover quickly if your data becomes unavailable. DB Systel UK offer cost effective services that will evolve your data protection strategy, for both your on-premise virtual and physical environments and data stored in both public and private cloud, including the ability to backup and restore data between hybrid environments.

Following a consultation to understand your data protection needs, DB Systel UK will design a complete backup solution and manage the configuration, security, compliance, reporting and operation of your backup service. Our 24/7 service desk provides assurance that we will be there to recover your data whenever you need it.

Our cloud backup solution is designed to be cost effective by ensuring that you only pay for the capacity that you need, and storage tiering is used to automatically transfer your older backups to low cost storage. Application consistent backups are provided without service disruption, meaning that your SQL and NoSQL databases and applications, including Microsoft Exchange, SharePoint and Active Directory don't need to be offline for a backup to be taken. Restores can be performed quickly allowing you to meet even the shortest recovery time objectives, and at a file level, meaning your cloud data transfer costs are kept to a minimum.

For on-premise workloads, we offer the same level of protection and recovery, with the option of tiering backups to the cloud to reduce retention costs and provide an offsite disaster recovery position.

Whether you need to evolve from legacy tape backup, implement an elastic cost-effective backup solution, or utilise the expertise and experience of the DB Systel UK backup services, contact us to find out more.
